As an enthusiastic Software Engineer, your opportunity has piqued my interest. When going over the requirements for that position, I was excited to see that all responsibilities and duties listed will be a big step for me and my career which is just beginning.

I have secured my Bachelor's degree in Applied Computer Technology, concentrating in Software Engineering, from the United States International University with a current CGPA of 3.651. All of that plus more, has prepared me to be successful and a perfect fit for this position.

I have experience working with the 'MERN stack' (MongoDB, Express, React, NodeJS), Javascript and several of its various libraries and frameworks such React, Vue, Angular, Express, materialUI, fontawesome etc. NoSql databases such as Firebase, and Amazon DynamoDB including some other amazon web services like AWS S3 and Lambda and the implementation of restful APIs etc. I have also worked on projects I developed using the above listed technologies. I am very willing to go the extra mile to make sure the clients are fully satisfied with my work.

Please review my resume for a deeper look at my skills and accomplishments. The link to my Github with some of my past work is https://github.com/eldavido7. I look forward to hopefully discussing how my traits and capabilities will fit perfectly for this role. Thank you.

Sincerely,

David Awarri
